

**The Paradise Project** – A regeneration project covering 42 acres in the heart of the city - opening summer 2008, whilst Liverpool is the European Capital of Culture. The largest construction site currently in Europe.

Matrix Contractors were experiencing practical problems in cleaning the 55,000 m<sup>2</sup> of new underground car park flooring.

They asked Tensid to help with both the practical and time consuming difficulties.

Tensid responded by taking their Aquila water recycling pressure washer to demonstrate its capabilities. A unique machine in the UK and developed exclusively by Aquila in Denmark.

Matrix had cleaned an area of 160m<sup>2</sup> which had taken 4 men 8 hours to clean! Using the Aquila machine to clean the same size area, it took 2 men just 30 minutes – quite a result.

In addition they had to constantly refill the water tank then dispose of the dirty water by using tanks and a fork lift truck. This was clearly impractical and time consuming.

With the Aquila TD302REC water recycling machine and floor cleaning tool, there is no need to refill the water tank as the machine collects waste water, filters then recycles it allowing the same water to be used again and again. In addition there is no water splashing. It saves, water, time, energy - the environment.

Matrix hired the machine from Tensid to clean not only the car parks by also the external areas as well in combination with Tensid's Safety Klean new build cleaner, a successful hydrochloric acid free cleaner. All in time for the amazing Paradise Street complex in Liverpool to be visited by Her Majesty the Queen in May!

Many contractors and local authorities find that hiring self contained pressure washing equipment to be both a practical and economical way of dealing with certain specific cleaning projects. Tensid provide a hire service for their Aquila trailer mounted, self contained hot water pressure washers including the recycling machine described above.
